From the early 80's Eurostat have been amongst the earliest European pioneers for ESD protection. With more than 40 years of manufacturing experience, Eurostat has based its growth model on manufacturing at least 70 % of the value of the products sold.

This is how Eurostat has acquired a unique and recognized expertise, with a vertically integrated manufacturing facility, covering raw material extrusion, vacuum forming, flexible packaging manufacturing, and all the necessary secondary operations needed for bespoke packaging solutions. Due to the synergy offered by belonging to the Dou Yee group, the investment in production equipment has been accelerated since 2006, with more than 1M€ invested in new production lines over the last 4 years in the French factory. With the opening of a production facility in Poland, Eurostat will duplicate its manufacturing expertise to cover the Eastern European market with renewed dedication.

As the voting member for France in the IEC committee, we offer an ESD expertise that we fulfill by engineering new solutions (new materials or finished products...) to satisfy the latest technical evolutions of the industry. We have also invested in our in house ESD characterization laboratory for a better service to our customer. Moreover, we provide audits and structured training programs following a very complete structure.

With a direct presence in 7 European countries, and a global presence in Asia and US thanks to Dou Yee group, we are able to cover global requirements with a local focus.

At Eurostat, satisfaction of our customers is at the heart of our day to day activities. We are committed to providing you with the highest quality level of products and services.

We are involved in safety and environmental issues; we manage industrial risks and physical hazards in order to ensure health and safety for all. Our products are made from raw materials that do not contain any Substances of Very High Concern (SVHC) according to the ECHA and both REACH and RoHS regulations are met.

Our Quality Department monitors continuous improvement, with an emphasis on performing internal audits in order to maintain our quality management system and identify potential trends. Eurostat Group has been officially ISO 9001 certified for more than 10 years now and we offer you the possibility to become your partner in the training and education of your employees.

RIGID PACKAGING

RIGID PACKAGING

Eurostat's aim is to offer some innovative solutions for the protection of devices sensitive to ESD hazards and particle contamination, during production and shipment phases.

To achieve this target, Eurostat made massive investments in extrusion technology, vacuum forming, assembly and machining of plastic materials.

This integrated production enables Eurostat to be a dedicated supplier for handling and packing of industrial products sensitive to micro-nuisances.

Over the year, Eurostat has acquired specific industrial know how resulting in some original patent pending industrial processes. Thanks to 40 years of experience in thermoplastic extrusions, Eurostat have engineered some proprietary compounds, such as E-STAT® or Nano-STAT®, to offer appropriate and competitive solutions for the protection against ESD hazards.

Eurostat are involved in partnerships to propose innovative logistic solutions meeting emerging and future customer needs.

The Eurostat's developments and properties:

- E-STAT®
- Nano-STAT®
- Production tools (patent pending), for an unique industrial know-how

TRAYS PACKED DIRECTLY ON PALLET

For thick trays, Eurostat develop bespoke solutions for direct palletisation and to make the following gains:

- No waste of packaging, for a cost-effective and environmentally safe alternative
- Time saving with the simplification of nomenclature
- Reusable pallet

PALLET PACK

For thin trays ($\leq 2\text{mm}$), Eurostat offer a unique concept, with "Pallet Pack". A conductive solution, from the lid to the pallet and belt

- Stackable container
- The lid can be folded in 2 parts for a much easier access
- For the logistics loops of disposable trays, the Pallet Pack reduces the return volume by 1/13.
- Elimination of cartons or tote boxes

EUROSTAT are today in a position to provide the widest range of ESD safe foam qualities:

- Carbon impregnated material provides uniform and permanent protection for ESD safe sensitive devices. It is perfect for long term packaging of semiconductor components due to its low ionic contamination and out gassing.
- Pink low tribocharging and dissipative foams are inexpensive and perform a general cushioning and product protection function within the EPA.

Available in 2 types:

- PU open cells for “propping up” applications
- PE closed cell product for non-shedding and routing applications

**TRAINING, AUDIT
AND SERVICE**

1. ESD DAMAGE OR INTERFERENCE IN ELECTRONICS

Electrostatic Discharges (ESD) can damage a sensitive electronic component, resulting in failures, reduced reliability and increased rework costs, or latent component failures in equipment in the field.

ESD can also cause interference with the operation of electronic systems. Static electricity can build up high voltages in operating environments (over 10 KV is not uncommon and over 30KV has been recorded).

A simple action, such as a person getting up from a chair, can cause a rise in body voltage to 10KV.

The latest submicron lithography process at the component level increases the sensibility to discharges. Some metallization layers can be degraded with discharge levels of a few 10V.

ESD produce fast high current waveforms and fast magnetic (H-field) or electrostatic (E-field) disturbances. These can induce voltages or currents in nearby sensitive circuitry and corrupt data or cause spurious failures.

2. TRAINING YOUR EMPLOYEES

As the ESD sensitivity of the products increases the production operators and production coordinators need to adapt to a very demanding technical environment. In order to make sure that the operators follow proper procedures, it is advised and requested to provide professional ESD training.

Eurostat is a certified training institute (**agreement number: 43390015239**) and provides training experts supervised by the French President of TC 101.

3 LEVELS OF TRAINING:

+ Level 1 – ESD Awareness

Attendees	Goal	Recommended training session duration
<ul style="list-style-type: none"> Operators Manufacturing support Management without engineering background 	<ul style="list-style-type: none"> To understand why and how damages and defects, due to static electricity occur To have a clear view of the wide spectrum of risks, damages and defects in case of non-adherence or drift from the rules and means of prevention Etc. 	about 3h30

+ Level 2 – Technical coordinator

Attendees	Goal	Recommended training session duration
<ul style="list-style-type: none"> Technicians Engineers Process/equipment support or management with engineering background 	<ul style="list-style-type: none"> To take care that all prevention rules are implemented and respected by all personnel working within or entering an EPA et audits To be aware of the basic methods and tools currently used to make measurements into an EPA Etc. 	about 4h30

+ Level 3 – In house expert

Attendees	Goal	Recommended training session duration
<ul style="list-style-type: none"> ESD coordinators Supervisors Instructors 	<ul style="list-style-type: none"> To establish a complete Prevention and Control Plan preventing from static electricity To propose progress axis and fitted preventive or corrective actions To prepare in-house audits thanks to punctual helps of third-part ESD experts Etc. 	about 3h00

Our training programs, which are continuously improved and updated, can be adapted to companies' individual needs and tailored to suit your company and the ESD experience of your employees. Training can be provided in English.

After each training session, a personalized certificate is presented to each attendee.

3. AUDIT AND REPORTS

The site audit gives an effective way of rapidly evaluating and documenting any electrostatic issues affecting your site and facilities.

Our objectives are:

- To highlight existing in-situ gaps with what is recommended through IEC 61340-5-1/2 international standard
- To analyze and understand any electrostatic issues in discussion with your technical representative
- To give guidance and propose remedial actions

The Site Visit

The site visit is a fact-finding visit in which our consultant surveys key parts of the site and the customer's processes and procedures.

It is also an opportunity for you to highlight and discuss any particular areas of concern you may have.

For these reasons it is essential to make your on-site technical representative available to act as a guide and to be a technical support.

Our consultant will normally spend a day visiting the site and investigating key areas of concern.

Electrostatic related measurements such as electrostatic field potential and resistance measurements are made where it is appropriate to check the status of equipment, processes, floors and other relevant items.

The Report

The report gives some relevant electrostatic information and explanation of key aspects where possible.

It typically records:

- details of our consultant's findings including the results of any measurements
- conclusions and specific recommendations
- list of literature and relevant standards that might be required for reference and further reading material if applicable

4. TECHNICAL SERVICE AND INSTALLATIONS

A technical service ensures the installation and maintenance of equipment as well as repairs during the guarantee period.

The range setting and control procedures of measuring equipment could be also carried out.

Eurostat has a new Research and Characterization Laboratory for materials subjected to electrostatic discharges.

This system allows us to test the products quality and efficiency, to propose customized studies and to be one of the pioneers for electrostatic events control.
